Graphene Ink Will Let Us Print Circuits On Pretty Much Anything

JAMIE CONDLIFFE 6 NOVEMBER 2013 2:00 AM

Modern miracle stuff graphene has been used by developers to print circuits on clothing, creating a genuinely wearable form of tech that doesn't rely on bulky watches, AR glasses or [sewing computers into your flesh](#).

Given that graphene's USP is that it manages to work despite only being one atom thick, it creates a form that's ultimately flexible. To show off the possibilities, Cambridge University has managed to print a piano circuit board onto fabric using a conductive graphene ink while also printing a digital display onto a bendy bit of plastic.

The creator suggests printable circuits might be handy for embedding health monitors in clothing, although we're imagining a future where graphene phone displays can be printed on our hands, stomachs and thighs. Having a television printed on your thighs would certainly solve the watching-TV-in-bed problem. [\[Telegraph\]](#)
